

ACTIVITY 1

1. Pick 1 Website with a good UI/UX and write 1 paragraph explaining why.

Airbnb is a great example of a website with excellent UI/UX design. Its interface is clean and visually driven, using large, high-quality images that immediately draw users into the experience of a listing rather than overwhelming them with text or clutter. The search and filter system is intuitive, allowing users to narrow down options by location, dates, price, and amenities without feeling complicated, while the layout maintains a consistent, uncluttered grid across listings that makes browsing feel effortless. Micro-interactions like smooth hover effects, instant map updates as you scroll through listings, and clear visual feedback when selecting dates make the site feel responsive and polished. Additionally, the navigation is simple and predictable, with a clear path from search to booking, which reduces friction and builds user trust. Altogether, Airbnb balances aesthetic appeal with functional simplicity, making it easy for users of varying tech skill levels to find and book a place to stay without confusion.

2. Pick 1 Website with a bad UI/UX and write 1 paragraph explaining why.

Priceline is often cited as an example of poor UI/UX design within the travel and accommodation booking space. The homepage feels cluttered and overwhelming, packing multiple booking modules (flights, hotels, cars, packages, "Express Deals") into a small space with competing calls-to-action, making it unclear where a user should even start. The information hierarchy is inconsistent pricing, discounts, and promotional banners are scattered across the page with varying font sizes and colors, creating visual noise rather than guiding the eye naturally. Navigating through the booking flow can feel confusing, with unclear steps, unexpected pop-ups, and pricing that sometimes changes or reveals hidden fees late in the process, which erodes user trust. The mobile experience compounds these issues further, as the dense layout doesn't always adapt cleanly to smaller screens, forcing users to zoom or scroll excessively. Compared to Airbnb's clean, image-first, minimalist approach, Priceline's interface feels transactional and overloaded, prioritizing promotional content over a smooth, intuitive user journey.
